

1 Employees

The interface uses the SAGE Employee Works number to identify employees.

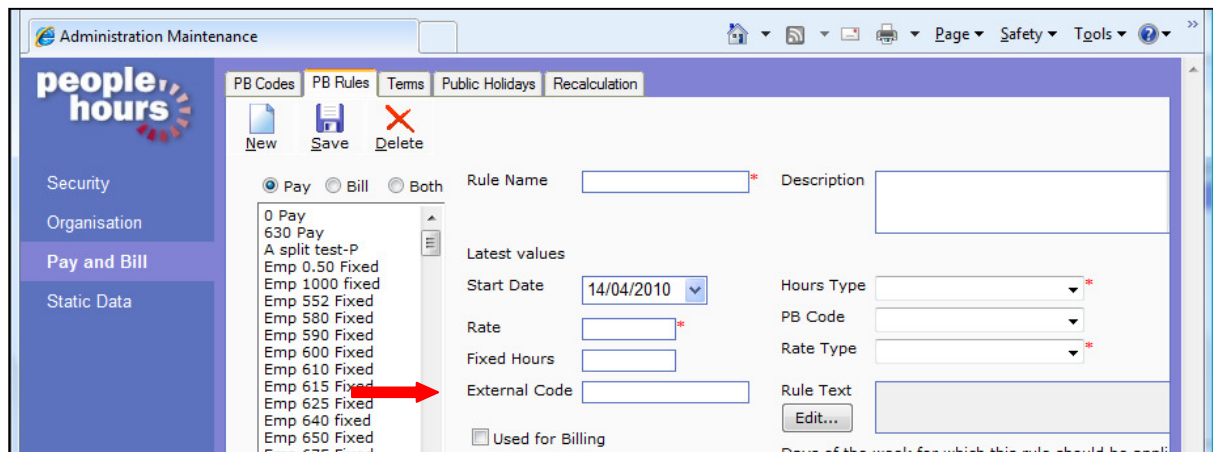

This information needs to be stored in the Staff Number field on the Schedule: Employee Data: Service screen.

2 PB Rules

The interface uses the SAGE Payment type to identify the type of payment to be processed.

The SAGE Payment type description needs to be stored in the External Code field on the Administration: ay and Bill: PB Rules screen where the payment type description entered matches the type of payment generated by the PB Rule.

3 Information Required

Gallinet will also need to know the following:

- 1 The version of SAGE payroll that is installed on the host PC. This is required to ensure that the correct DLLs are installed
- 2 The format of the data output required, e.g. detailed or summary information.

4 Customer Requirements

- 1 The interface is normally installed on the PC on which the SAGE payroll application has been installed.
- 2 The SAGE PC must have access to the internet to allow data to be extracted from peoplehours
- 3 Each time that an update is applied to the SAGE installation, Gallinet will need to be advised so that the correct DLLs for the new SAGE version can be supplied. If this is not done, the interface will fail if an update has been applied
